*Dr. Fedorov, has long campaigned against the secrets and environmental health issues caused by chemical weapons manufacturing and storage in the former Soviet Union. This book describes the history of chemical weapons using information from Soviet archives (military, state, economic and communistic, etc.). According to Dr. Fedorov, all the material is absolutely new and unknown to Western readers, especially details of the creation and secret preparation of an offensive chemical warfare capability in the Soviet Union against an unspecified enemy. The chapters Dr. Fedorov translated and sent to us is replete with documentation on the relationship and interactions between the Intelligence service and the "Military Chemical Directorate". While the translation is a bit stilted, the information is clear. The documentation of cooperation between the German and Soviet military to share chemical weapon technology and production is extensive. The sharing of similar information, including visits between country leaders to chemical weapons displays and testing, with Italy and China was more brief, but still intriguing. -- Library ASA09-3*

### **VOLUME I. A LONG WAY TO CHEMICAL WAR**

The History of preparation of the Soviet Country to the offensive chemical war which has found all attributes of war total, to its citizens is not known.

The motor of preparation for that war was Red/Soviet Army, its aggressive and often irresponsible generals. Since 20th, and before military-chemical service, and before chemical forces put first of all offensive purposes. Becoming of the military-chemical doctrine occurred in the Red Army in process of its development and a hardware. The only thing in what at \_\_\_\_\_ and other bodies of military command were not any doubts so it with a view of development of military-chemical art. However, this circumstance was not known to a society never. It is not known now <sup>32</sup>. Meanwhile expensive and diverse activity of army and the industry on preparation for offensive chemical war against people, vegetation and animals "the probable opponent" has the direct attitude to present realities. Namely - to ecological conditions in Russia and the countries, made mighty Soviet Union there is.

In this book we shall try to draw a picture of that senseless history. Unfortunately, scale preparation for offensive chemical war has appeared very ruinous for not too rich country. And it is obvious. However, it was represented important to estimate as well consequences for people and for the ground of our country of that preparation for unnecessary war.
